Unit	Phase 8 (9?)	Stage	Stratum	PoM
Summary				

**Opened:** Grey fill observed in western two-thirds of L9922 above, extending partially to

- Limits (N)** Bounded by L9969 to the North.  
**(S)** Bounded by the unexcavated material below W9066 to the South.  
**(E)** Bounded by L9969 and L9968 to the East.  
**(W)** Bounded by the unexcavated material below W9914 to the West.

**Closed:** Not closed end of season. A surface was reached at the lowest level of [L9954], however this surface is probably a tip line surface and not a floor. A new locus should begin '94.

**Matrix:** Semi-loose light grey fill with some sherds, bone, and worked flint. This differs from the fallen mudbrick material of L9968 and L9969.

**Relations:** [L9954] is covered by L9922 and L9923. [L9954] is the continuation of the matrix of L9923, which was the upper level of the fill of [L9954] as it sloped to the South. The matrix of [L9954] is the continuation of the matrix of the western two-thirds of L9922, which was not recognized as such until F9902 had been removed in this area. The fill of L9954 reaches the fallen mudbrick material of L9968 and L9969. The matrix of L9954 continues in the unexcavated material below W9914 and W9066.

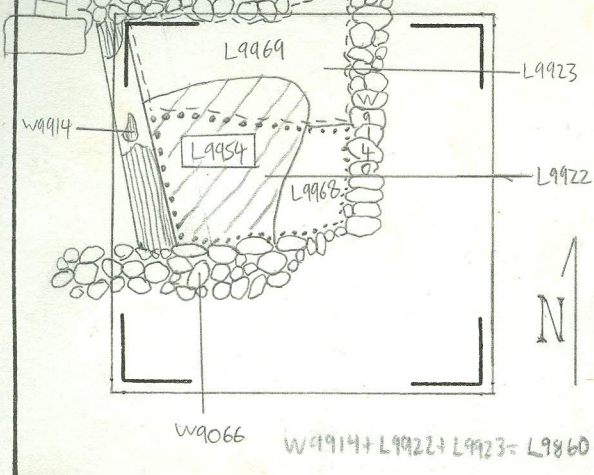

IS DP: in 2003 + 2004 it was determined that at the end of the phase 9 destruction they were collapsed m.b. piles along the walls, making a "L" shaped configuration (L9969 + 9968). The hollow between them was gradually filled w. layers of ash + phytoliths. This is thus per definition, phase 8.

**Additional Observations/Value:** Iron I leveling fill.  
Medium High Value.
